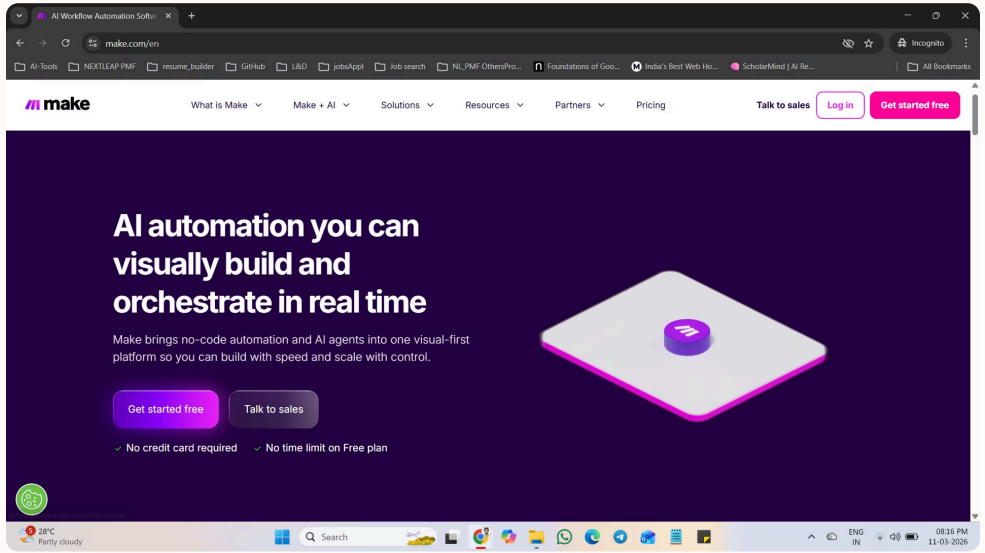
# What is Make.com?

Make.com is a visual workflow automation platform that allows users to connect apps and automate workflows without coding. Teams can integrate tools like Google Sheets, Slack, Gmail, Notion, and AI services to automate repetitive tasks.



## Core Capabilities:

- Connect 3000+ applications
- Build visual automation workflows
- Automate repetitive business tasks
- Integrate AI tools and APIs

## Business Model:

- Free plan with limited operations
- Paid plans based on automation usage

# Target Users & Their Needs

## Rahul (Growth Marketer)

**Goals:**

- Automate lead capture
- Sync CRM across tools
- Schedule marketing workflows

**Pain Points:**

- Manual data entry
- Switching between multiple platforms
- Time spent exporting and importing data

## Ananya (Ops Manager)

**Goals:**

- Automate reporting
- Sync operational data
- Reduce administrative work

**Pain Points:**

- Repetitive tasks
- Data fragmentation across tools
- Manual workflows

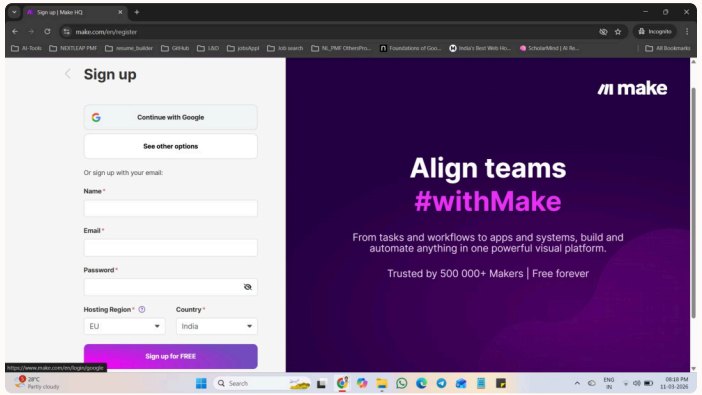
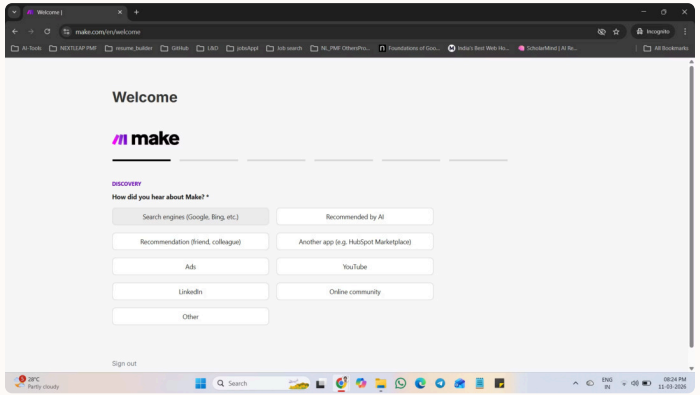
# Make.com Onboarding Flow — Part 1

After signing up, Make.com guides users through a short onboarding process to understand their background and context. The platform begins by collecting basic information about the user and their experience with automation.



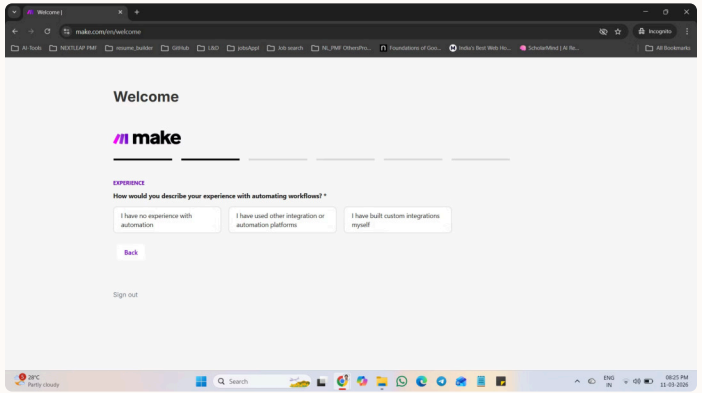
## Step 1 — Account Signup

Users create an account using email or Google authentication.



## Step 2 — Discovery Question (Q1)

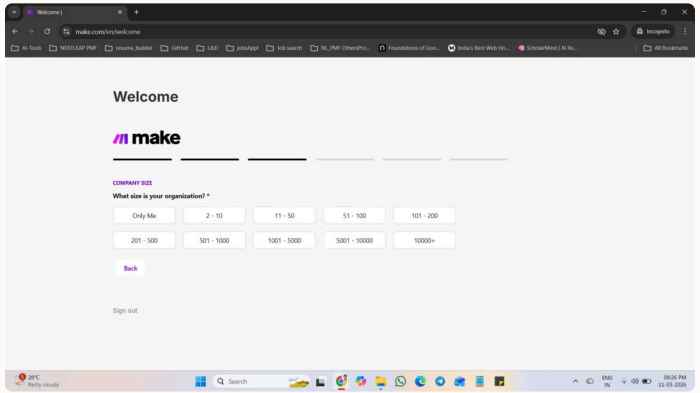
Make asks how the user heard about the platform to understand acquisition channels.



## Step 3 — Automation Experience (Q2)

Users indicate their familiarity with automation tools.

These questions help Make understand the user's background before recommending automation workflows.



## Step 4 — Company Size (Q3)

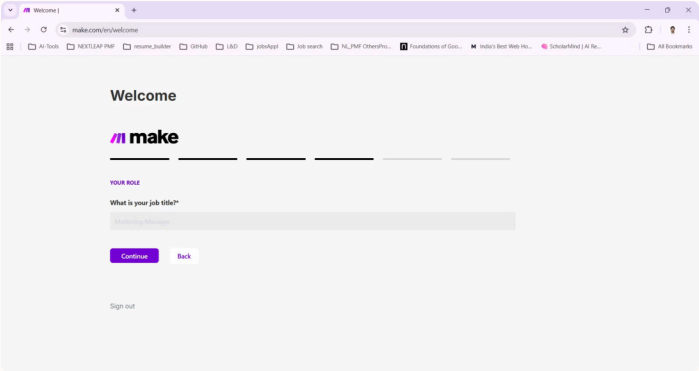
Users select the size of their organization to help segment users.

Made with GAMMA

# Make.com Onboarding Flow — Part 2

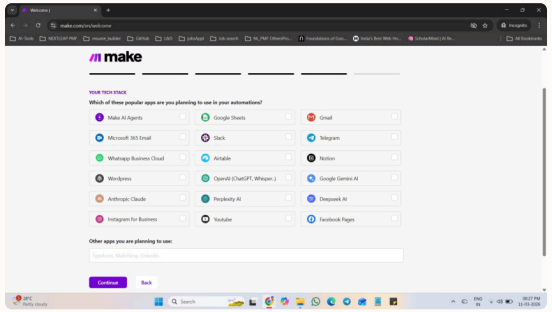
After collecting initial background information, Make continues onboarding by identifying the user's role, tools, and automation goals. These responses help the platform understand the user's context before showing the main dashboard.

## User Segmentation Questions



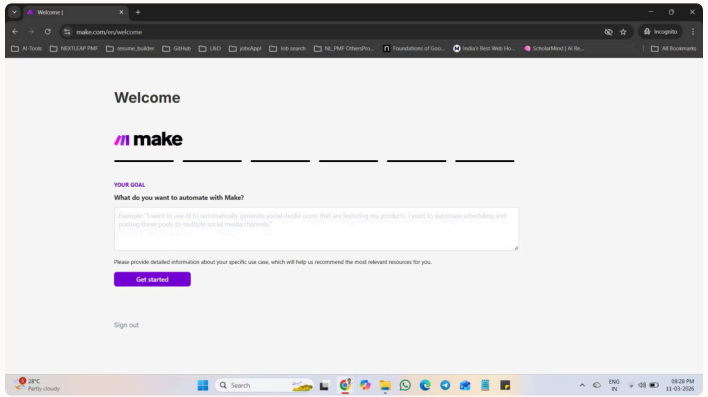
### Step 5 — Job Role (Q4)

Users specify their job title or role to help Make understand how they plan to use automation.



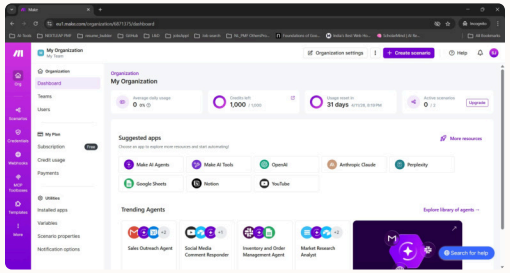
### Step 6 — Tech Stack (Q5)

Users select the apps they use such as Slack, Google Sheets, Notion, Gmail, or CRM tools.



### Step 7 — Automation Goal (Q6)

Users describe what they want to automate.



### Make Dashboard

Users land on the dashboard to start building their first automation.

After completing onboarding, users land on the Make dashboard where they can start building their first automation scenario.

# Pain Point 1 — Survey Data Goes to Waste

## Problem

Valuable onboarding data—such as job role and tech stack—is collected but fails to influence the initial dashboard experience.

## PM Insight

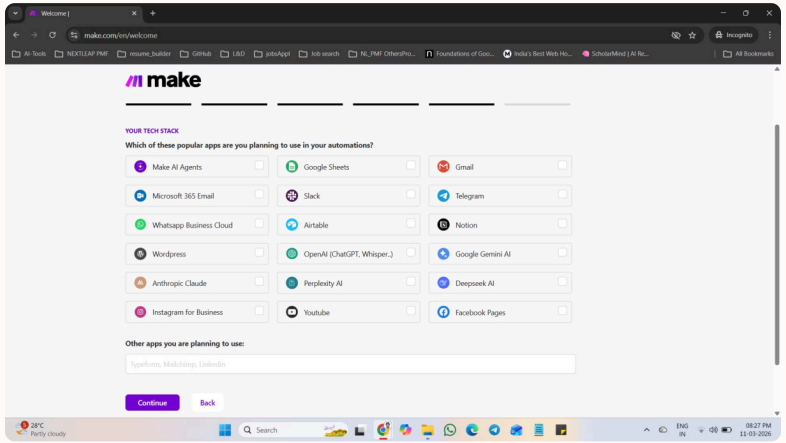
The survey creates an expectation of personalization that the product currently fails to meet, making onboarding questions feel disconnected and unnecessary.

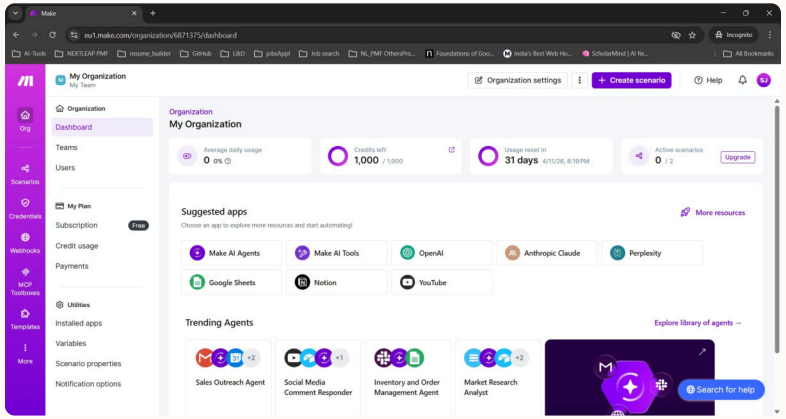
## Recommendation

Leverage onboarding responses to tailor the user experience:

- Pre-filter templates based on selected apps.
- Recommend 3 relevant automation scenarios.
- Highlight user-selected integrations.

**Impact:** High | **Effort:** Medium





*User-selected tools during onboarding are not reflected in the dashboard recommendations.*

Made with GAMMA

# Pain Point 2 — First Automation Decision is Unclear

## Problem

Users must choose between "Build from scratch" or "Start with a template" immediately. New users lack the context to make this decision, leading to confusion.

## PM Insight

The system forces a complex choice before the user understands the value proposition. Beginners lack visibility into:

- Scenario architecture
- App integration requirements
- Template applicability

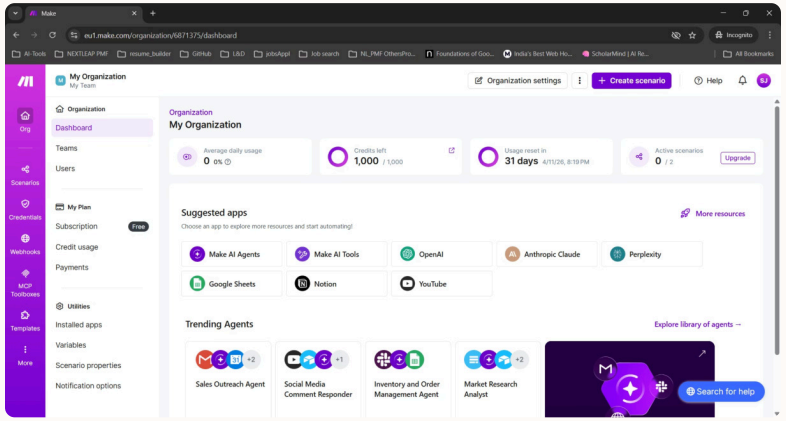
This creates immediate friction and hesitation at the first critical action point.

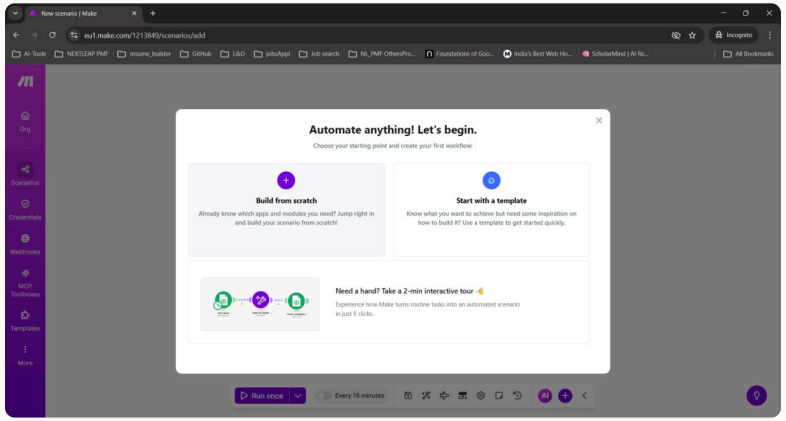
## Recommendation

Replace the forced choice with a guided onboarding flow:

- Auto-recommend templates based on onboarding data
- Surface 2–3 relevant automation workflows
- Initiate a guided "first scenario" tutorial

**Impact:** High | **Effort:** Medium





*Users must decide how to build their first automation before understanding the system.*

# Pain Point 3 — 'Operations' Metric Is Confusing

## Problem

Dashboard shows remaining operations without context.

- Unclear count definitions
- Unknown consumption rates
- Workflow limit uncertainty

## PM Insight

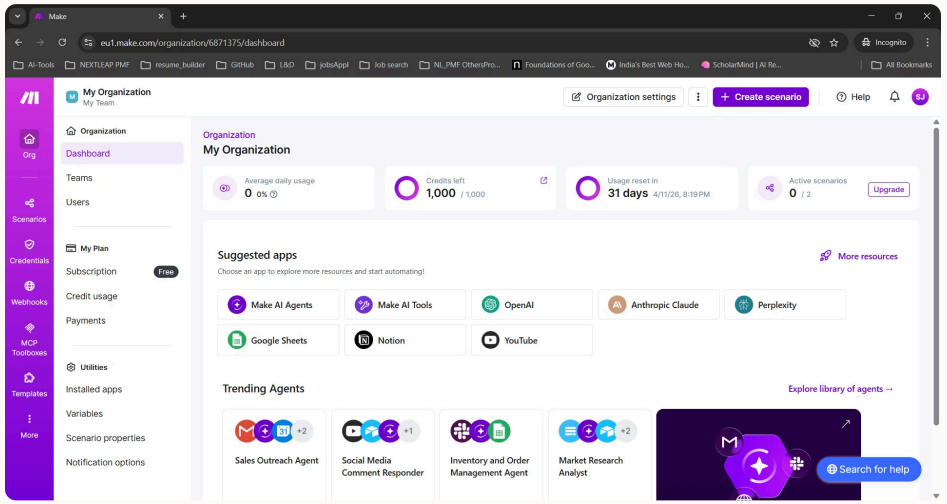
Metric is platform-specific and jargon-heavy. Users worry about limits and struggle to estimate usage.

## Recommendation

Clarify usage concept directly in dashboard:

- Add descriptive tooltips
- Surface real-world usage examples
- Display estimates before execution

**Impact:** Medium–High | **Effort:** Low



*Users see remaining operations but the metric is not clearly explained.*

# What Make.com Does Well

Despite some onboarding friction, Make provides a powerful automation platform with several strong capabilities.

## Product Strengths:

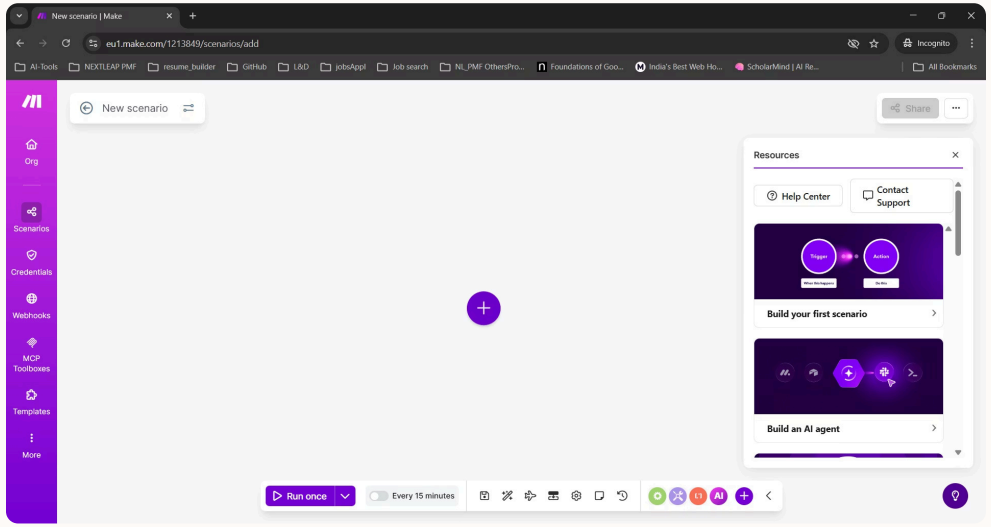
Drag-and-drop interface for building workflows without coding.

Supports 3000+ integrations including Google Sheets, Slack, Notion, Gmail, and AI tools.

Supports filters, routers, scheduling, and conditional automation flows.

Pre-built automation templates help users start workflows quickly.

- Visual Automation Builder
- Large Integration Ecosystem
- Flexible Automation Logic
- Strong Template Library



Make's visual automation builder enables users to design complex workflows without code.

# Metrics to Track

To evaluate and improve the onboarding experience, product teams should track key user behavior metrics that indicate whether users successfully understand and adopt the platform.

## Key Metrics

### Activation Rate

Percentage of users who create their first automation scenario after onboarding. This indicates whether users successfully understand how to start using the platform.

### Time to First Automation

Average time it takes for a new user to create their first working scenario. A long time suggests onboarding friction.

### Template Usage Rate

Percentage of users who start automation using templates instead of building from scratch. This helps evaluate how helpful templates are for new users.

### Onboarding Drop-off Rate

Percentage of users who abandon the product before creating their first automation. This helps identify friction points in onboarding.
